Introduction

The KLOCK driver enables communication between the Studio system and a set of devices using the SUCOM1 protocol by serial link, according to the specifications discussed in this document.

This document was designed to help you install, configure, and execute the KLOCK driver to enable communication with these Klockner-Moeller devices. The information in this document is organized as follows:

- Introduction: Provides an overview of the KLOCK driver documentation.
- General Information: Provides information needed to identify all the required components (hardware and software) used to implement communication between Studio and the KLOCK driver.
- Installing the Driver: Explains how to install the KLOCK driver.
- Configuring the Device: Explains how to configure the Klockner-Moeller device.
- Configuring the Driver: Explains how to configure the communication driver.
- Executing the Driver: Explains how to execute the driver to verify that you installed and configured the
 driver correctly.
- Troubleshooting: Lists the most common error codes for this protocol and explains how to fix these errors.
- Sample Application: Explains how to use a sample application to test the driver configuration.
- Revision History: Provides a log of all modifications made to the driver and the documentation.

B

Notes:

- This document assumes that you have read the "Development Environment" chapter in the product's Technical Reference Manual.
- This document also assumes that you are familiar with the Windows NT/2000/XP environment. If you are unfamiliar with Windows NT/2000/XP, we suggest using the Help feature (available from the Windows desktop Start menu) as you work through this guide.

General Information

This chapter explains how to identify all the hardware and software components used to implement serial communication between the Studio KLOCK driver and devices using the SUCOM1 protocol.

The information is organized into the following sections:

- Device Characteristics
- Link Characteristics
- Driver Characteristics

Device Characteristics

To establish serial communication, you must use devices with the following specifications:

- Manufacturer: Klockner-Moeller Devices
- Compatible Equipment:
 - PS316/PS306
 - PS32
 - PS4-201-MM1
 - PS416
 - Any device that is compatible with the SUCOM1 protocol

For a list of the devices used for conformance testing, see "Conformance Testing" on page 4.

Link Characteristics

To establish serial communication, you must use links with the following specifications:

- Device Communication Port: Serial
- Physical Protocol: RS232
- Logic Protocol: SUCOM1
- Device Runtime Software: None
- Specific PC Board: None

Driver Characteristics

The KLOCK driver is composed of the following files:

- KLOCK.INI: Internal driver file. You must not modify this file.
- KLOCK.MSG: Internal driver file containing error messages for each error code. You must not modify this file.
- KLOCK.PDF: Document providing detailed information about the KLOCK driver.
- KLOCK.DLL: Compiled driver.

Notes:

- All of the preceding files are installed in the /DRV subdirectory of the Studio installation directory.
- You must use Adobe Acrobat[®] Reader[™] (provided on the Studio installation CD-ROM) to view the KLOCK.PDF document.

You can use the KLOCK driver on the following operating systems:

- Windows XP/2K/XP
- Windows CE

KLOCK – Driver Version 1.07 Doc. Revision B – July 07, 2004

For a list of the operating systems used for conformance testing, see the "Conformance Testing" section.

Conformance Testing

The following hardware/software was used for conformance testing:

Equipment: PS416Configuration:

COM Port: COM1
Baud Rate: 9600
Data Bits: 8
Stop Bits: 2
Parity: None

Cable: Use specifications described in the "Link Characteristics" section

Operating System (development): Windows XP with Service Pack 1

Operating System (target):

Windows 2000/XP

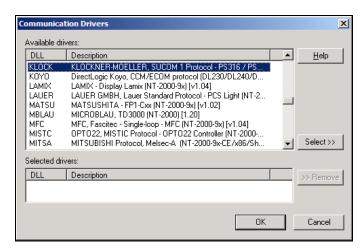

Windows CEStudio Version: 6.0Driver Version: 1.07

Installing the Driver

When you install Studio version 5.1 or higher, all of the communication drivers are installed automatically. You must select the driver that is appropriate for the application you are using.

Perform the following steps to select the driver from within the application:

- 1. Open Studio from the Start menu or double-click the Studio shortcut icon on your desktop.
- 2. From the Studio main menu bar, select File → Open Project to open your application.
- 3. Select Insert → Driver from the main menu bar to open the Communication drivers dialog.
- 4. Select the KLOCK driver from the Available Drivers list, and then click the Select button.

Communication Drivers Dialog

5. When the KLOCK driver displays in the Selected Drivers list, click the OK button to close the dialog.

It is not necessary to install any other software on your computer to enable communication between Studio and the device. However, to download the custom program to your device you must install a Klockner-Moeller programmer software package. Consult the Klockner-Moeller documentation for installation instructions.

Attention:

For safety reasons, you must use special precautions when installing the physical hardware. Consult the hardware manufacturer's documentation for specific instructions in this area.

Configuring the Device

Because there are several brands of equipment that use the SUCOM1 protocol, it is impossible to define a standard device configuration. Therefore, we suggest using the following default configuration:

Protocol: RS232Baud Rate: 9600Data Bits: 8

• Stop Bits: 1 (To PS316/PS306 or PS32) or 2 (To PS4-201-MM1 or PS416)

Parity: Even (To PS316/PS306 or PS32) or None (To PS4-201-MM1 or PS416)

Configuring the Driver

After opening Studio and selecting the **KLOCK** driver, you must configure the driver. Configuring the KLOCK driver is done in two parts:

- Specifying communication parameters (only one configuration needed).
- Defining communication tags and controls in the Communication tables or *Driver* worksheets (Standard and Main Driver Worksheets).

Worksheets are divided into two sections, a *Header* and a *Body*. The fields contained in these two sections are standard for all communications drivers — except the **Station**, **Header**, and **Address** fields, which are driver-specific. This document explains how to configure the **Station**, **Header**, and **Address** fields only.

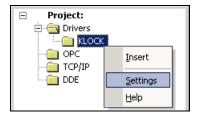

For a detailed description of the Studio Standard and Main Driver Worksheets, and information about configuring the standard fields, review the product's *Technical Reference Manual*.

Setting the Communication Parameters

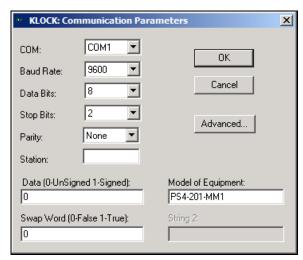

Use the following steps to configure the communication parameters, which are valid for all driver worksheets configured in the system):

- 1. From the Studio development environment, select the Comm tab located below the Workspace.
- 2. Click on the *Drivers* folder in the *Workspace* to expand the folder.
- 3. Right-click on the *KLOCK* subfolder and when the pop-up menu displays, select the **Settings** option:

Select Settings from the Pop-Up Menu

The KLOCK: Communications Parameters dialog displays:

KLOCK: Communication Parameters Dialog

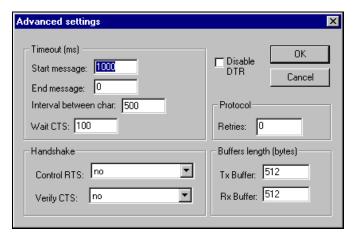

4. Specify the parameters as noted in the following table:

Parameters	Default Values	Valid Values	Description
Station	0	0	Not required for this driver
Data (0-Signed Value 1-Unsigned Value)	0	0 or 1	0: Signed values 1: Unsigned values
Model of Equipament PS4-201-MM1 PS316/PS306 PS32		PS316/PS306	Equipment Type
Swap Word (0 - False 1 -True)	0	0 or 1	Swapping Words for Float Point data type

These parameters must be configured *exactly the same* as those you configured for the KLOCK driver in the *Communications Parameters* dialog.

5. Click the Advanced button on the Communication Parameters dialog to open the Advanced Settings dialog:

Advanced Settings Dialog

Notes:

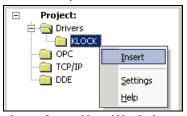

- Do not change any of the default Advanced settings parameters at this time.
 You can consult the Studio *Technical Reference Manual* for information about configuring these parameters for future reference.
- Generally, you must change these parameters only if you are using a DCE (Data Communication Equipment) converter (such as 232/485), modem, and so forth between your computer, the driver, and the host. However, before adjusting the Advanced communication parameters, you must be familiar with the characteristics of the DCE.

Configuring the Standard Driver Worksheet

This section explains how to configure a *Standard Driver Worksheet* (or Communication table) to associate application tags with the PLC addresses. You can configure multiple *Driver* worksheets — each of which is divided into a *Header* section and *Body* section.

Use the following steps to create a new Standard Driver Worksheet:

- 1. From the Studio development environment, select the Comm tab, located below the Workspace pane.
- 2. In the Workspace pane, expand the Drivers folder and right-click the KLOCK subfolder.
- 3. When the pop-up menu displays, select the Insert option:

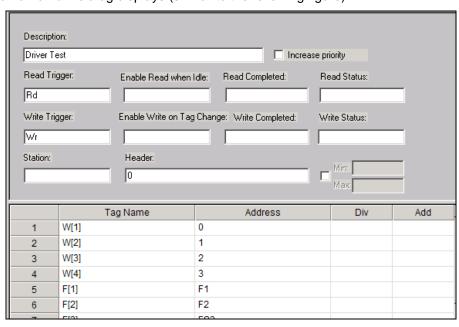

Inserting a New Worksheet

Note:

To optimize communication and ensure better system performance, you must tie the tags in different driver worksheets to the events that trigger communication between each tag group and the period in which each tag group must be read or written. Also, we recommend configuring the communication addresses in sequential blocks to improve performance.

The *<drivername>.drv* dialog displays (similar to the following figure):

KLOCK Driver Worksheet

4. Use the following information to complete the Station, Header, and Address fields on this worksheet:

Station field: This field may be left blank.

Header field: Address of the operand in the PLC memory. It must be a HEXADECIMAL value corresponding to one word in the marker area or any valid area.

Also, you can type a tag string in brackets {Tag} into the Header field, but you must be certain that the tag's value is correct and that you are using the correct syntax, or you will get an Invalid Header error.

The following table lists all of the data types and address ranges that are valid for the **Header** field:

After specifying the **Station** and **Header** parameters, proceed to the next section for instructions on how to configure the **Address** field.

CONFIGURING THE ADDRESS FIELD

The body of the *Driver* worksheet allows you to associate each tag to its respective address in the device. Type the tag from your application database into the **Tag Name** column. This tag will receive values from or send values to an address on the device.

The address must comply with the following syntax:

The address must comply with the following syntax:

<FloatFlag><AddressOffset> (for example: 10)

or

<FloatFlag><AddressOffset>.<Bit> (for example: 10.3)

Where:

- FloatFlag is an optional flag. When configured, this parameter must be F (Float Point) or FP (Float Point, swapping the high word with the low word).
- AddressOffset is a parameter added to the Address Header parameter (configured in the Header field) to compose the address to be read from or written to the device. Must be a decimal number.
- Bit is the bit number (from 0 15) of the word address. This parameter is *optional*.

Attention:

- In the *Driver* worksheet, the start address is defined by the sum of the Header (from the Header field) and the lowest <AddressOffset> parameter (in the Address field).
- The Bit Write is supported only when executing the "Enable Write On Tag Change" command.
- You must not configure a range of addresses greater than the maximum block size (data buffer length) supported by each PLC within the same Driver worksheet. The maximum data buffer length for this driver is 32 bytes per Standard Driver Worksheet.

Address Configuration Sample			
Device Address	Header Field	Address Field	
1	1	0	
10	0	10	
1020	3E8	20	
1020	0	1020	

Address Configuration Sample			
Device Address	Header Field	Address Field	
10	Α	0	
11	Α	1	
12	С	0	
10 ,11	С	F0	
10, 11 (with word swap)	С	FS0	
10,11	0	F5	
10,11	0	FS5	
10,11	6	F2	
10,11	6	FS2	
1	1	0	
10	0	10	
1020	3E8	20	
1020	0	1020	
10	Α	0	
1	1	0	
10	0	10	
1020	3E8	20	
1020	0	1020	

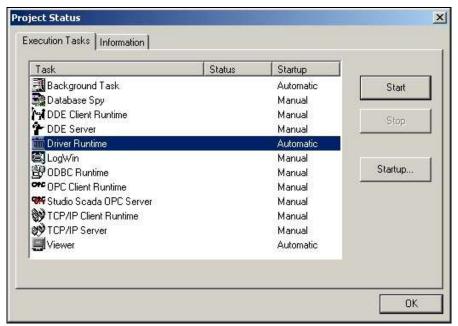

Executing the Driver

After adding the KLOCK driver to a project, Studio sets the project to execute the driver automatically when you start the run-time environment.

To verify that the driver run-time task is enabled and will start correctly, perform the following steps:

1. Select **Project** → **Status** from the main menu bar.

The Project Status dialog displays:

Project Status Dialog

- 2. Verify that the *Driver Runtime* task is set to **Automatic**.
 - If the setting is correct, click **OK** to close the dialog.
 - If the Driver Runtime task is set to Manual, select the Driver Runtime line. When the Startup button becomes active, click the button to toggle the Startup mode to Automatic.
- 3. Click **OK** to close the *Project Status* dialog.
- 4. Start the application to run the driver.

Troubleshooting

If the KLOCK driver fails to communicate with the device, the tag you configured for the **Read Status** or **Write Status** fields will receive an error code. Use this error code and the following table to identify what kind of failure occurred.

Error Code	Description	Possible Causes	Procedure to Solve
0	ОК	Communication without problems	None required.
2	Invalid Memory Address	Invalid Header configured in Driver Sheet.	-
3	Invalid Offset	Invalid Address configured in Diver Sheet	-
4	Send Data Block Exceeded Limit	Range of address configured in Driver Sheet exceeded limit of 32 words	Specify a valid offset or create a new worksheet. Typically, maximum offset is 32.
6	Check Sum Error	Ack action error during communication	 Check the cable wiring Check the station number Check the RTS/CTS configuration (see Studio Technical Reference Manual for valid configurations).
7	Invalid Number of received bytes	Unexpected length of the answer	Check driver Communication Parameters.
41	Incorrect Message to PLC	Receive Invalid Message	 Check the cable wiring Check the station number Check the RTS/CTS configuration (see Studio Technical Reference Manual for valid configurations).
42	PLC is not Ready to Receive	PLC is not Ready to receive messages	 Check cable wiring Check the PLC state – it must be RUN. Check the station number Check the RTS/CTS configuration (see Studio Technical Reference Manual for valid configurations).
43	Invalid Command	Try write bits without use "Enable write on Tag change"	-
-15	Timeout Start Message	 Disconnected Cables PLC is turned off, in stop mode, or in error mode Wrong station number Wrong RTS/CTS control settings 	 Check cable wiring Check the PLC state – it must be RUN. Check the station number Check the RTS/CTS configuration (see Studio Technical Reference Manual for valid configurations).
-17	Timeout between rx char	 PLC in stop mode or in error mode Wrong station number Wrong parity Wrong RTS/CTS configuration settings 	 Check cable wiring Check the PLC state – it must be RUN. Check the station number Check the RTS/CTS configuration (see "Link Characteristics" for valid RTS/CTS configurations).

⇒ Tip:

You can verify communication status using the Studio development environment *Output* window (*LogWin* module). To establish an event log for Field Read Commands, Field Write Commands, and Serial Communication right-click in the *Output* window. When the pop-up menu displays, select the option to set the log events. If you are testing a Windows CE target, you can enable the log at the unit (Tools \rightarrow LogWin) and verify the celog. txt file created at the target unit.

If you are unable to establish communication with the PLC, try to establish communication between the PLC Programming Tool and the PLC. Quite frequently, communication is not possible because you have a hardware or cable problem, or a PLC configuration error. After successfully establishing communication between the device's Programming Tool and the PLC, you can retest the supervisory driver.

To test communication with Studio, we recommend using the sample application provided rather than your new application.

If you must contact us for technical support, please have the following information available:

- Operating System (type and version): To find this information, select Tools → System Information.
- Project Information: To find this information, select Project → Status.
- **Driver Version** and **Communication Log**: Displays in the Studio *Output* window when the driver is running.
- Device Model and Boards: Consult the hardware manufacturer's documentation for this information.

Sample Application

You will find a sample application in the /COMMUNICATION EXAMPLES/KLOCK directory. We strongly recommend that you use this sample application to test the KLOCK driver before configuring your own customized application, for the following reasons:

- To better understand the information provided in the section of this document.
- To verify that your configuration is working satisfactorily.
- To certify that the hardware used in the test (device, adapter, cable, and PC) is working satisfactorily before you start configuring your own, customized applications.

This application sample is not available for all drivers.

Use the following procedure to perform the test:

- 1. Configure the device's communication parameters using the manufacturer's documentation.
- 2. Open and execute the sample application.
- 3. Execute the Viewer module in Studio to display information about the driver communication.

➡ Tip:

You can use the sample application screen as the maintenance screen for your custom applications.

Revision History

Doc. Revision	Driver Version	Author	Date	Description of Changes
-	1.01		Jan/1997	Inclusion of automatic offset calculation
-	1.02	Roberto V. Junior	Jan/1997	Inclusion of String Field to define the Equipment in use.
-	1.03	Roberto V. Junior	Apr/1997	Fixed Read of Long Value.
-	1.04	Roberto V. Junior	Mar/1998	Fixed wrong EndAddress in WriteItemStart
-	1.05	Roberto V. Junior	Feb/1999	Included read of short int (signed)
А	1.06	Fabio H. Y. Komura	Feb/2004	Included Float Point Register Type
В	1.07	Fabio H. Y. Komura	Jul/2004	Conformance to Windows CE.
