Q: Why does the screen display nothing after booting up my TouchPAD?

A: There are many reasons that can cause this. We list the most probable things below to help you solve this problem.

- Maybe it comes from the mismatch between the version of MiniOS8 and the version of HMIWorks that builds the project.
 - Download the MiniOS8 again. To ensure that MiniOS8 is matched with the version of HMIWorks, download the MiniOS8 in the installation directory of this version of HMIWorks.
 - That is, find out the MiniOS8 at "C:\ICPDAS\HMIWorks_Standard\bin\boot\[MODEL]"
- If the updating of MiniOS8 fails too, though you may think it's impossible, change the USB port and try to download again.
 - We have cases that changing to another USB port or even another computer can solve the problem. So do not hesitate to try it.
- Finally, contact ICP DAS if the problem still exists.
 - Mail to: service@icpdas.com for further information.
