

How can I implement motion control in I-8417/8817/8437/8837 ?

18.1: Install motion driver

Limitation:

1. I-8437/8837 **CAN NOT** do ethernet communication when using I-8091 to do motion control, while W-8xx7 doesn't have this limitation.
2. Only one I-8091 board in I-8417/8817/8437/8837 & W-8xx7 can do X-Y dependent motion, other I-8091s should be moving independent. Or all I-8091s are moving independent.

The I-8417/8817/8437/8837 & Wincon-8xx7 can integrate with the I-8091 to do Motion control. The default ISaGRAF driver burned in the Flash memory of the I-8417/8817/8437/8837 controller is for general usage not for motion control. Please update it to the motion driver by yourself. While user don't need to upgrade the driver of Wincon-8xx7 if its driver version is 3.08 or higher.

The motion driver of I-8417/8817/8437/8837 can be found in the ICP DAS CD-ROM.

Restriction of the motion driver of I-8417/8817/8437/8837:

The motion driver for I-8417/8817/8437/8837 doesn't support the Ethernet communication, however W-8xx7 doesn't have this limitation.

18.2: Introduction

18.2.1: System Block Diagram

The I-8091 stepping motor control card is a micro-computer controlled, 2-axis pulse generation card. It includes a 2Kbytes-FIFO to receive motion command from host, a micro-computer for profile generation and protection, 2-axis DDA chip to execute DDA function when interpolation command is used, 2500Vrms optical isolation inserted for industrial application.

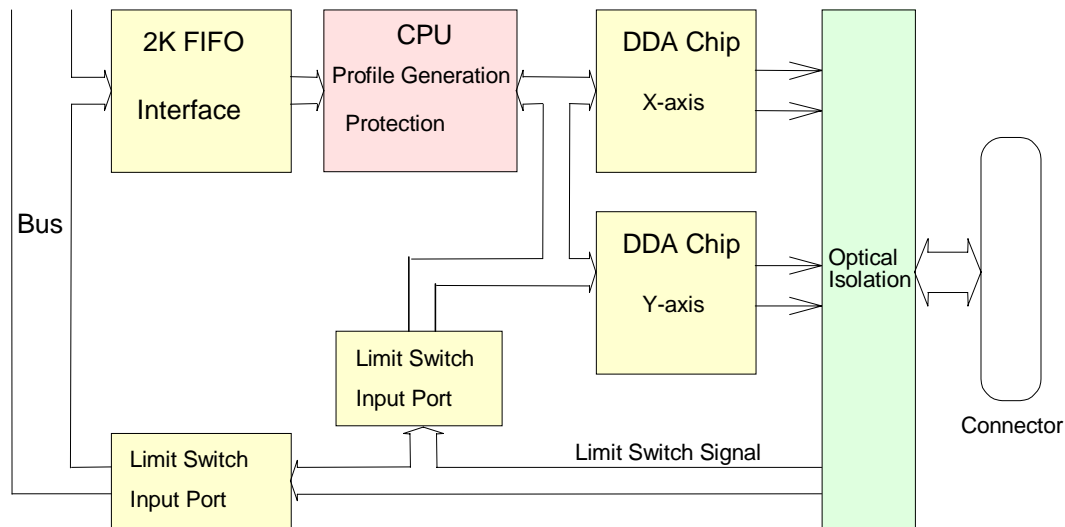

Fig.(1) block diagram of I-8091 card

18.2.2: DDA Technology

The DDA chip is the heart of I-8091 card, it will generate equal-space pulse train corresponding to specific pulse number during a DDA period. This mechanism is very useful to execute pulse generation and interpolation function. The DDA period can be determined by DDA cycle. Table(1) shows the relation among DDA cycle, DDA period and output pulse rate. When DDA cycle set to 1, the DDA period is equal to $(1+1) \times 1.024\text{ms} = 2.048\text{ms}$. The output pulse number can be set to 0~2047, therefore the maximum output pulse rate will be 1Mpps. The minimum output pulse rate is 3.83pps when set DDA cycle=254 (DDA period = $(254+1) \times 1.024\text{ms} = 261.12\text{ms}$).

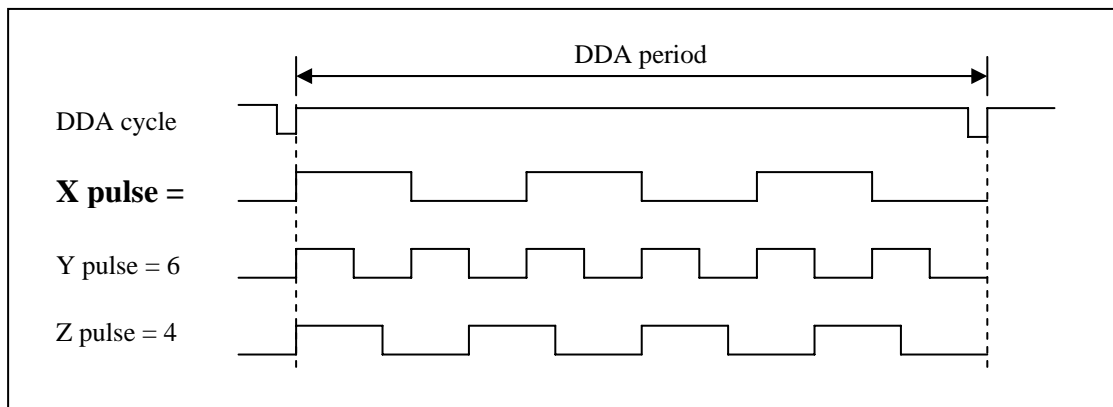

Fig.(2) DDA mechanism

Table(1) The Relation among DDA cycle, DDA period and output pulse rate.

DDA cycle	DDA period	Max. pulse rate(n=2047)	Min. pulse rate (n=1)
1	2.048ms	999511pps	488pps
2	3.072ms	666341pps	325pps
3	4.096ms	.	.
.	.	.	.
N	(N+1)*1.024ms	2047/(DDA period)	1/(DDA period)
.	.	.	.
254	261.12ms	7839pps	3.83pps

The DDA cycle can be set by i8091_SET_VAR() command which deccribed in charppter 3. The selection criterion of DDA cycle was described as following.

1. The required max. output pulse rate.

$$PR_{max} = \frac{V_{max} * N / 60}{2047}$$

$$PR_{max} = \frac{V_{max} * N}{(DDA_{cycle} + 1) * 1.024ms * 60}$$

PRmax : max. output pulse rate.

Vmax : max. speed (rpm).

N : the pulse number of stepping motor per revolution (pulse/rev).

2. The required speed resolution.

The maximum output pulse number is Np(0~2047), therefore the speed resolution is Vmax(max. speed)/Np. The DDA cycle can be obtained by following equation.

$$PR_{max} = \frac{Np}{(DDA_{cycle} + 1) * 1.024ms}$$

3. When choose large DDA cycle (DDA period), it will occur vibration between different pulse input which generally can be observed during acceleration or deceleration. So, the small DDA cycle , the smooth acceleration/deceleration curve as long as the speed resolution is acceptable.

Example: Stepping Motor

The spec. of stepping motor is 500 pulse/rev, max. speed 500 rpm, speed resolution 2 rpm.

The required max. pulse rate

$$PR_{max} = 500 \text{ rpm} * 500 / 60 = 4166.67 \text{ pps}$$

The maximum output pulse

$$Np = 500 \text{ rpm} / 2 \text{ rpm} = 250 \text{ pulse number}$$

The DDA cycle can be calculated by follow equation

$$PR_{max} = \frac{Np}{(DDA_{cycle} + 1) * 1.024ms}$$

$$4166.67 = \frac{250}{(DDA_{cycle} + 1) * 1.024ms}$$

DDA cycle = 58
 High Speed = 247 pulse (4166.67*58*0.001024)

The above results means that maximum speed is 500rpm when send command i8091_SET_VAR(0, 58, 2, 2, 247) to I-8091 card.

Example: Pulse type input Servo Motor

The spec. of servo motor is 8000 pulse/rev, max. speed 3000 rpm, speed resolution 2 rpm.

The required max. pulse rate

$$PR_{max} = 3000 \text{ rpm} * 8000 / 60 = 400,000 \text{ pps}$$

The maximum output pulse

$$Np = 3000 \text{ rpm} / 2 \text{ rpm} = 1500 \text{ pulse number}$$

The DDA cycle can be calculated by follow equation

$$PR_{max} = \frac{Np}{(DDA_{cycle} + 1) * 1.024ms}$$

$$400,000 = \frac{1500}{(DDA_{cycle} + 1) * 1.024ms}$$

DDA cycle = 3
 High Speed = 1638 pulse (400,000*4*0.001024)

The above results means that maximum speed is 3000rpm when send command i8091_SET_VAR(0, 3, 2, 2, 1638) to I-8091 card.

18.3: Hardware

18.3.1: I-8000 hardware address

The hardware address of I-8000 main system is fixed as following table. There are 4 slots I-8000 and 8 slots I-8000.

	Slot 0	Slot 1	Slot 2	Slot 3	Slot 4	Slot 5	Slot 6	Slot 7
I-8000, 4 slot address	0x080	0x0A0	0x0C0	0x0E0	---	---	---	---
I-8000, 8 slot address	0x080	0x0A0	0x0C0	0x0E0	0x140	0x160	0x180	0x1A0

18.3.2: LED Indicator

/ORG1: X-axis's original limit switch for machine home position.
 /LS11, /LS14 : X-axis's negative and positive limit switches.

18.3.3: Hardware Configuration

Limit switch configuration

Because the profile generation and protection is executed by the CPU on I-8091 card, the limit switches must configure as following diagram. The motion command just can work properly.

Fig.(5) Limit switch configuration of X axis

Fig.(6) Limit switch configuration of Y axis

Output pulse mode configuration

I-8091 card provide two kind output method.

- (a) CW/CCW mode
- (b) Pulse/Direction mode

The command **M_s_mode(card_NO_, modeX_, modeY_)** provide parameters 0: CW_CCW and 1: PULSE_DIR to define output pulse mode.

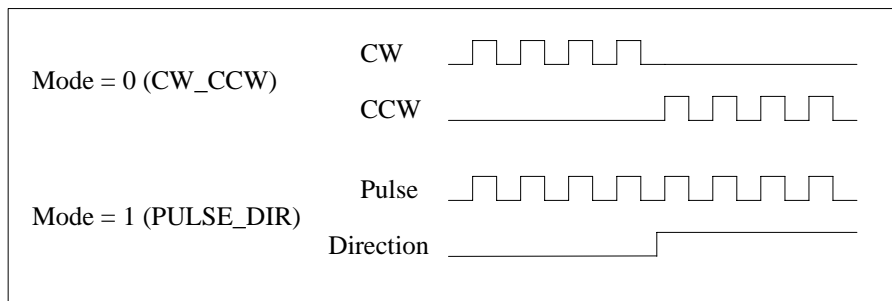

Fig.(7) Output pulse mode

Direction configuration

Sometimes, the output direction of X-axis, Y-axis is not in the desired direction due to the motor's connection or gear train. It is recommended to unify the output direction as shown in Figure(5)(6). The CW/FW direction is defined as toward outside from motor and the CCW/BW direction is defined as toward inside to motor. The **M_s_dir(card_NO_, defdirX_, defdirY_)** command provides parameters 0: NORMAL_DIR and 1: REVERSE_DIR to define the rotating direction of motor.

Turn Servo ON/OFF (Hold ON/OFF)

To turn servo motor into servo ON(OFF) state, or turn stepping motor into hold ON(OFF) state, the command **M_s_serv(card_NO_, sonX_, sonY_)** provide parameters 1:ON and 0:OFF to turn ON or OFF.

Automatic protection

The I-8091 card has a automatic protected system.

- (a) If X-axis command is executing and moving toward CW/FW direction, X-axis will immediately stop when LS14 is touched. To release this protection as long as X-axis move toward CCW/BW direction.
- (b) If X-axis command is executing and moving toward CCW/BW direction, X-axis will immediately stop when LS11 is touched. To release this protection as long as X-axis move toward CW/FW direction.
- (c) If Y-axis command is executing and moving toward CW/FW direction, Y-axis will immediately stop when LS24 is touched. To release this protection as long as Y-axis move toward CCW/BW direction.
- (d) If Y-axis command is executing and moving toward CCW/BW direction, Y-axis will immediately stop when LS21 is touched. To release this protection, as long as Y-axis move toward CW/FW direction.
- (e) If the signal of the emergency limit switch /EMG was found in CPU firmware, all motion will be terminated and stop.

Set limit switch as normal close condition

The limit switches /EMG, /LS11, /LS14, /LS21, /LS24, /ORG1, /ORG2 is initially normal open condition, that is, these signal is active when connect it to ground. In industrial application, it might be recommended normal close condition, that is, these signal is active when open from ground.

The **M_s_nc(card_NO_, sw_)** command can be set sw=0 (default), for normal open condition. When set sw=1, for normal close condition.
